

Based on the provided content, I will break down the assignment into smaller tasks and provide a detailed explanation of each requirement. **Backend (Node.js, Express)**

The goal is to develop a REST API using Node.js and Express that allows CRUD operations for charging stations. * Requirements: +

Implement CRUD operations for charging stations:

- Create a new charging station -

Read (List) all charging stations -

Update a charging station - Delete a charging station + Implement User

Authentication using JWT: - Register

(Signup) API - Login API (Issue JWT

token) - Protected Routes for

managing charging stations - Store

charging station details including:

- Name - Location (Latitude &

Longitude) - Status

(Active/Inactive) - Power

Output (kW) - Connector Type

* Task Breakdown: + Day 1: Set up Backend

(CRUD for Charging Stations, Auth APIs)

- Create a new Node.js project using Express

- Implement CRUD operations for charging stations

- Implement User Authentication using JWT +

Day 2: Implement Frontend Login & Charger Listing

- Create a login screen that interacts with the

backend API - Build a charger listing

page that displays all onboarded chargers **Frontend
