

Congratulations on receiving this assignment!

Building a full-stack application using Node.js, Express, and a database of your choice is an exciting project. I'm here to help you understand the requirements and provide a step-by-step guide to complete the assignment.

Breakdown of the Requirements The assignment has three main components:

1. **Backend** (Node.js, Express):

- * Develop a REST API using Node.js and Express.
- * Use any database of your choice (e.g., MongoDB, PostgreSQL, MySQL).
- * Implement CRUD operations for charging stations.
- * Implement User Authentication using JWT.

2. **Frontend** (Vue.js):

- * Create a Login Screen that interacts with the backend API.
- * Build a Charger Listing Page:
 - + Display all onboarded chargers.
 - + Add filters (e.g., status, power output, connector type).

- + Add/Edit/Delete chargers.
- * Develop a Map View:
 - + Display all onboarded

chargers on a map using Google Maps or OpenStreetMap.
+ Clicking a marker should show the charger details.

3. **Deployment**:

- * Deploy both the backend and frontend on any cloud platform (e.g., AWS, Heroku, Vercel, Render, Firebase Hosting).

Ensure the backend has a public API endpoint accessible for testing.

Step-by-Step Guide Day

1: Set up Backend (CRUD for Charging Stations, Auth APIs)

- * Create a new Node.js project and install the
