

Congratulations on receiving this assignment!

Building a full-stack application using Node.js, Express, and a database of your choice is an exciting project. I'm here to help you understand the requirements and provide a step-by-step guide to complete the assignment.

Breakdown of the Requirements The assignment has three main components: 1. **Backend** (Node.js, Express):

- * Develop a REST API using Node.js and Express.

- * Use any database of your choice (e.g., MongoDB, PostgreSQL, MySQL).
- * Implement CRUD operations for charging stations.

- * Implement User Authentication using JWT.

2. **Frontend** (Vue.js):

- * Create a Login Screen that interacts with the backend API.

- * Build a Charger Listing Page:

- + Display all onboarded chargers.

- + Add filters (e.g., status, power output, connector type).

- + Add/Edit/Delete chargers.

- * Develop a Map View:

- + Display all onboarded

- chargers on a map using Google Maps or OpenStreetMap.

- + Clicking a marker should show the charger details.

3. **Deployment**:

- * Deploy both the backend and frontend on any cloud platform (e.g., AWS, Heroku, Vercel, Render, Firebase Hosting).

- * Ensure the backend has a public API endpoint accessible for testing.

Step-by-Step Guide Day 1: Set up Backend (CRUD for Charging Stations, Auth APIs)

- * Create a new Node.js project and install the

Congratulations on receiving this assignment! Building a full-stack application using Node.js, Express, and a database of your choice is an exciting project. I'm here to help you understand the requirements and provide a step-by-step guide to complete the assignment.

****Breakdown of the Requirements****

The assignment has three main components:

- **Backend** (Node.js, Express):**
 - * Develop a REST API using Node.js and Express.
 - * Use any database of your choice (e.g., MongoDB, PostgreSQL, MySQL).
 - * Implement CRUD operations for charging stations.
 - * Implement User Authentication using JWT.
- **Frontend** (Vue.js):**
 - * Create a Login Screen that interacts with the backend API.
 - * Build a Charger Listing Page:
 - + Display all onboarded chargers.
 - + Add filters (e.g., status, power output, connector type).
 - + Add/Edit/Delete chargers.
 - * Develop a Map View:
 - + Display all onboarded chargers on a map using Google Maps or OpenStreetMap.
 - + Clicking a marker should show the charger details.
- **Deployment**:**
 - * Deploy both the backend and frontend on any cloud platform (e.g., AWS, Heroku, Vercel, Render, Firebase Hosting).
 - * Ensure the backend has a public API endpoint accessible for testing.

****Step-by-Step Guide****

Day 1: Set up Backend (CRUD for Charging Stations, Auth APIs)

- * Create a new Node.js project and install the required dependencies (Express, MongoDB, etc.).
- * Set up a MongoDB database and create a collection for charging stations.
- * Implement CRUD operations for charging stations using Express and MongoDB.
- * Implement User Authentication using JWT.

Day 2: Implement Frontend Login & Charger Listing

- * Create a new Vue.js project and install the required dependencies (Vue Router, Axios, etc.).
- * Set up a login screen that interacts with the backend API.
- * Build a charger listing page that displays all onboarded chargers.
- * Add filters and add/edit/delete chargers functionality.

Day 3: Integrate Map View & API Calls

- * Integrate a map view component using Google Maps or OpenStreetMap.
- * Make API calls to the
